

# # \*\*Vulnerability Assessment Report\*\*

## ## \*\*1. Introduction\*\*

A Vulnerability Assessment (VA) is a systematic process of identifying, analyzing, and prioritizing security weaknesses in systems, networks, or applications. The goal of this assessment is to detect vulnerabilities before attackers can exploit them and to recommend appropriate mitigation strategies to reduce risk.

---

## ## \*\*2. Scope of Assessment\*\*

The scope of this vulnerability assessment included:

- \* Web application security
- \* Server and system configuration
- \* Input validation and authentication mechanisms
- \* Common OWASP Top 10 vulnerabilities

### \*\*Assessment Type:\*\*

- \* Manual Testing
- \* Automated Scanning
- \* Limited Exploitation (Non-destructive)

---

## ## \*\*3. Tools Used\*\*

- \* \*\*Burp Suite\*\* – Web application testing
- \* \*\*Nmap\*\* – Network and port scanning
- \* \*\*Nikto\*\* – Web server vulnerability scanning

\* \*\*OWASP ZAP\*\* – Automated vulnerability detection

\* \*\*DVWA / OWASP Juice Shop\*\* – Test environment

---

## ## \*\*4. Methodology\*\*

The assessment followed a structured approach:

### 1. \*\*Information Gathering\*\*

- \* Identified target services and technologies
- \* Mapped application endpoints

### 2. \*\*Scanning\*\*

- \* Performed automated vulnerability scans
- \* Identified potential weaknesses

### 3. \*\*Vulnerability Analysis\*\*

- \* Validated findings manually
- \* Removed false positives

### 4. \*\*Risk Assessment\*\*

- \* Evaluated impact and likelihood
- \* Assigned severity levels

### 5. \*\*Reporting\*\*

- \* Documented vulnerabilities and mitigations

---

## \*\*5. Identified Vulnerabilities\*\*

### \*\*5.1 SQL Injection (SQLi)\*\*

**Description:**

Improper input validation allowed malicious SQL queries to be executed.

**Impact:**

- \* Authentication bypass
- \* Unauthorized database access

**Risk Level:** High

---

### \*\*5.2 Cross-Site Scripting (XSS)\*\*

**Description:**

User input was reflected or stored without proper output encoding.

**Impact:**

- \* Session hijacking
- \* Credential theft

**Risk Level:** Medium to High

---

### \*\*5.3 Security Misconfiguration\*\*

**\*\*Description:\*\***

Default settings and verbose error messages were enabled.

**\*\*Impact:\*\***

- \* Information disclosure
- \* Easier exploitation

**\*\*Risk Level:\*\* Medium**

---

**### \*\*5.4 Broken Authentication\*\***

**\*\*Description:\*\***

Weak password policies and missing account lockout mechanisms were observed.

**\*\*Impact:\*\***

- \* Credential stuffing attacks
- \* Account compromise

**\*\*Risk Level:\*\* High**

---

**## \*\*6. Vulnerability Summary Table\*\***

| Vulnerability | Severity | Affected Area        | Potential Impact |
|---------------|----------|----------------------|------------------|
| -----         | -----    | -----                | -----            |
| SQL Injection | High     | Login / Input Fields | Data breach      |

|                           |        |                |                   |
|---------------------------|--------|----------------|-------------------|
| Stored XSS                | High   | User Content   | Persistent attack |
| Reflected XSS             | Medium | URL Parameters | Session theft     |
| Security Misconfiguration | Medium | Server         | Info disclosure   |
| Weak Authentication       | High   | Login System   | Account takeover  |

---

## ## \*\*7. Risk Analysis\*\*

- \* \*\*High-risk vulnerabilities\*\* could lead to complete system compromise.
- \* \*\*Medium-risk vulnerabilities\*\* increase attack surface and assist attackers.
- \* \*\*Low-risk issues\*\* may still contribute to chained attacks.

Risk prioritization is essential for effective remediation.

---

## ## \*\*8. Recommended Mitigations\*\*

### ### \*\*8.1 Input Validation & Injection Prevention\*\*

- \* Use parameterized queries
- \* Implement server-side validation
- \* Sanitize all user inputs

### ### \*\*8.2 XSS Protection\*\*

- \* Apply output encoding
- \* Implement Content Security Policy (CSP)
- \* Use HTTPOnly and Secure cookies

### ### \*\*8.3 Authentication Security\*\*

- \* Enforce strong password policies
- \* Implement MFA
- \* Add account lockout and rate limiting

### ### \*\*8.4 Configuration Hardening\*\*

- \* Disable unnecessary services
- \* Remove default credentials
- \* Hide detailed error messages

---

## ## \*\*9. Result\*\*

The vulnerability assessment successfully identified multiple security weaknesses within the tested environment. Several high-risk vulnerabilities were found that could be exploited to compromise sensitive data and system integrity if left unpatched.
